Field of the Invention The present invention relates to a flexible circuit board and a semiconductor package in which the flexible circuit board is used. More specifically, the present invention relates to a flexible circuit board, in which at least part of a wiring pattern is formed on an insulating layer, and a semiconductor package which includes the flexible circuit board. 2. Related Art With development of miniaturization in semiconductor elements, sizes of semiconductor packages have been miniaturized. As a result, in the case where the sizes of semiconductor packages are small, the sizes of external connection terminals have also been reduced. With the reduction in the sizes of external connection terminals, pitch between the terminals has also been reduced. This further promotes reduction in sizes of the terminals, and reduction in area of the pads on the boards to which these terminals are mounted. However, with reduction in size of the pads, it becomes difficult to form a wiring pattern on the board or, in the case where such wiring pattern is formed, it becomes difficult to ensure sufficient rigidity of the wiring pattern, that is, the wiring pattern is easy to be affected by thermal stress in molding processes, etc. In the case where rigidity is insufficient, the wiring pattern may be detached from the board, or the wiring pattern may be affected by thermal stress, which may possibly cause disconnection of the terminal to be mounted on the board
